

Description

The C library function **int fputc(int char, FILE *stream)** writes a character (an unsigned char) specified by the argument **char** to the specified stream and advances the position indicator for the stream.

Declaration

Following is the declaration for fputc() function.

```
int fputc(int char, FILE *stream)
```

Parameters

char -- This is character to be written. This is passed as its int promotion.

stream -- This is the pointer to a FILE object that identifies the stream where the character is to be written.

Return Value

If there are no errors, the same character that has been written is returned. If an error occurs, EOF is returned and the error indicator is set.

Example

The following example shows the usage of fputc() function.

```
#include <stdio.h>

int main ()
{
    FILE *fp;
    int ch;

    fp = fopen("file.txt", "w+");
    for( ch = 33 ; ch <= 100; ch++ )
    {
        fputc(ch, fp);
    }
    fclose(fp);

    return(0);
}
```

Let us compile and run the above program, this will create a file **file.txt** in the current directory which will have following content:

```
!"#$%&'()*+,-./0123456789:;<=>?
@ABCDEFGHIJKLMNPQRSTUVWXYZ[\]^_`abcd
```

Now let's the content of the above file using the following program:

```
#include <stdio.h>

int main ()
{
    FILE *fp;
    int c;

    fp = fopen("file.txt","r");
    while(1)
    {
        c = fgetc(fp);
        if( feof(fp) )
        {
            break ;
        }
        printf("%c", c);
    }
    fclose(fp);
    return(0);
}
```
